 San José is the chief scapert of Guatemala on the Pacific Coast, and is only an open roadstead, deriving its importance from its connection by railroad with Guatemala City, 72 miles distant inland. It is located in Lat 13° 55' N, Long 90° 50' W. H O Chart 873.

2. There are two terminals at this port:

One is a combination dry cargo and cil terminal, comed and operated by the International Railways of Central America which consists of a long pier 920 ft from shore, with depths of 29 to 36 ft at its outer end and used entirely by small craft, (lighters and tugs) for the transsipment of goods to and from vessels moved in the readstead. Tankers consigned to this terminal moor stern to their duck boof ft distant with two enchors used for how mornings and others secured to two or more of the four buoys located abresset of the end of the pier, two on each side. Tunkers discharge over the stern by means of a floating 8" hose.

The second terminal, or beron, is located approximately 11 miles west of the IRCA terminal. This berth consists of mooring buoys - 2 aft and 1 forward on the part side. The ships anchor is used on the starboard bow. The berth is about 1600 ft from shore in 40 to 47 ft of water. Tankers discharge into a submarine pipeline with hose connections on the port side.

- 3. Deep-draft vessels (T-C typs) fully lader can discharge at these terminals, when see and veather conditions are normal.
- 4. As at other ports on the Central American Coast, winds at San José generally blow from a direction between south and south eastward and westward between lord AM and 9:00 PM, then a short interval of calm follows. Winds accompanied by heavy squalls and frequent rains prevail from the middle of May until October. These heavy squalle always blow from the east and last about 45 minutes, accompanied by heavy rains.
- 5. Vessels must exercise canthon while in the moorings and leave the readstead when heavy winds spring up.
